Instructions for Annotator A (500 items)

Thank you for helping. You will check and correct romanized Kannada written by an AI model.

What you need: the file `annotate_v2.html` from Aarnav, and Chrome or Edge on a laptop or desktop.

Getting started

1. Open `annotate_v2.html` in Chrome or Edge.
2. Type your name in the "Annotator" box. Use exactly the same name every time.
3. Keep "All 500 items" selected.
4. Click "New CSV file…" and save the file somewhere you will find again (for example, your Documents folder). Next time, click "Continue a CSV file…" and pick the same file.

For each item

You see a Kannada sentence, its English translation, and two AI drafts:

- **Natural romanization:** the Kannada typed in Latin letters, the way people type on a phone, word for word. English words that are already in the Kannada stay as they are.
- **Kanglish:** how a young person in Bengaluru would write the same message on WhatsApp, with English words mixed in where that is natural. It must keep the full meaning.

For each draft:

1. **Rate it first, before changing anything.**

- Naturalness: 1 (nobody would type this) to 5 (exactly how people type).
- Meaning: does it keep the meaning of the Kannada sentence? Yes or no.

1. **Then correct it** in the box so it reads naturally and keeps the full meaning. If it is already fine, leave it unchanged.
2. Click "Save and next". Your answers are written to your CSV file every time you save.

Rules

- Write the way you would really type. There is no single correct spelling.
- Do not use translation tools, AI tools or dictionaries.
- Do not discuss items with anyone else working on this project.
- Use the Note box for anything odd (for example, a Kannada sentence that is itself wrong).

Pace and sending your work

- About 25 items a day works well. Short sessions are fine; nothing is lost when you close the page.
- At the end of each week, send your CSV file to Aarnav.
- If something does not work, or a question comes up, ask Aarnav.
