Quick start: Annotator A (500 items)

Kannada romanization check. You need **annotate_v2.html** and Chrome or Edge on a laptop or desktop. Worked examples: **worked_examples.pdf**. Full instructions: **instructions.pdf**.

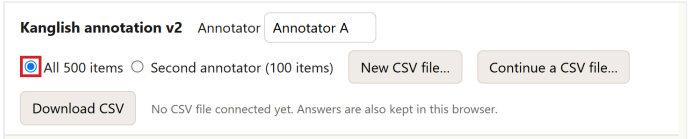

1 Open **annotate_v2.html** in Chrome or Edge (double-click it, or drag it into a browser window).

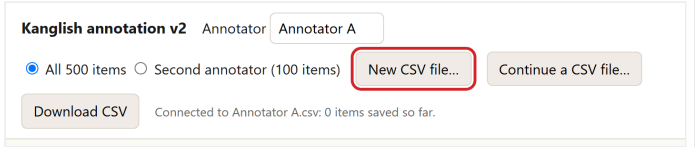

2 Type your name in the **Annotator** box (here "Annotator A"). Use exactly the same name every time.

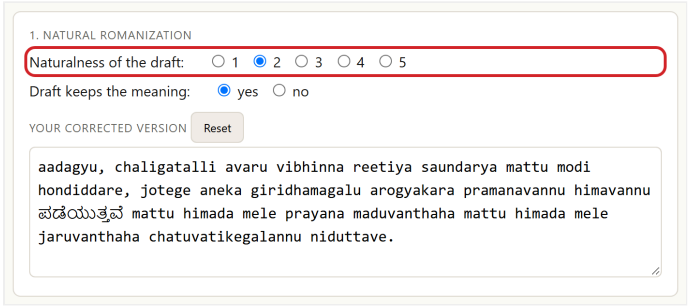

3 Keep **All 500 items** selected.

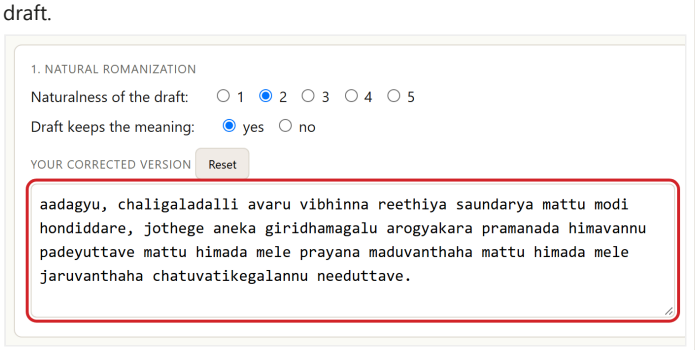

4 Click **New CSV file...**. A Save window opens: choose a folder you will find again (e.g. Documents) and click Save. The bar then says *Connected to ...csv*.

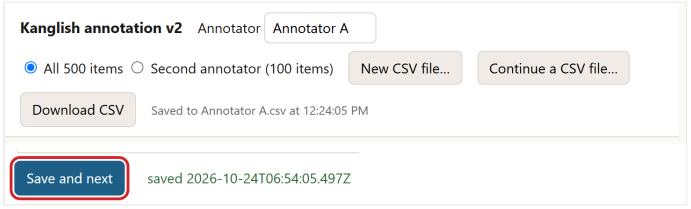

5 **Rate first**, before changing anything: naturalness 1–5 and whether the draft keeps the meaning (yes/no), for both drafts.

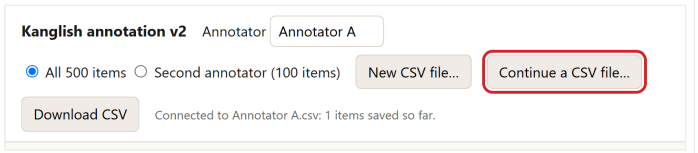

6 **Then correct** the draft in the box. If it is already fine, leave it unchanged (Reset brings the draft back). Do the same for the Kanglish draft.

7 Click **Save and next**. Every save rewrites your CSV file (the bar shows *Saved to ...csv*), so nothing is lost if you close the page.

8 **Next time:** open the page, enter the same name (and the same choice), click **Continue a CSV file...** and pick the same file. Then click **First unfinished**.

Pace: about 25 items a day; short sessions are fine. **Send your CSV to Aarnav at the end of each week** (attach the .csv file in WhatsApp as a Document). **Rules:** type the way you really type; there is no single correct spelling. No translation tools, AI tools or dictionaries. Do not discuss items with anyone. Use the Note box for anything odd. Questions or problems: ask Aarnav.
